Mucosite mouthwash is a new intervention that was reviewed. A single double-blind placebo controlled randomized trial showed a reduction in grade of mucositis in pediatric patients with acute lymphocytic leukemia (ALL) during chemotherapy. The team consensus was to categorize this as Effectiveness Not Established based on this single study.

The following intervention was categorized as Effectiveness Unlikely, which is a change from a previous review, which classified it as effectiveness not established.

- Calcium phosphate rinse

The following interventions were categorized as Recommended For Practice, which is consistent with prior reviews:

- Bicarbonate rinse
- Cryotherapy
- Oral care protocol

The following interventions were categorized as Effectiveness Not Established, which is consistent with prior reviews:

- Epidermal growth factor
- Polaprezinc
- Aloe vera
- Chamomile
- Herbal medicine
- Honey
- Prophylactic chlorhexidine
- Propolis

The following interventions were categorized as Likely To Be Effective, which is consistent with prior reviews:

- Palifermin for high dose chemo and HCT
- Benzydamine with XRT in head and neck cancer
